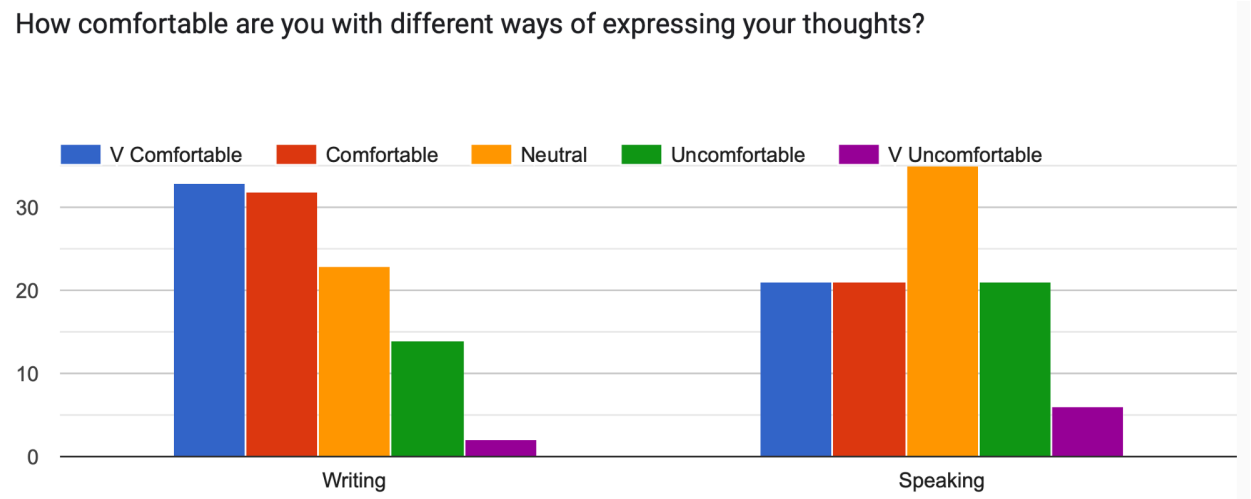
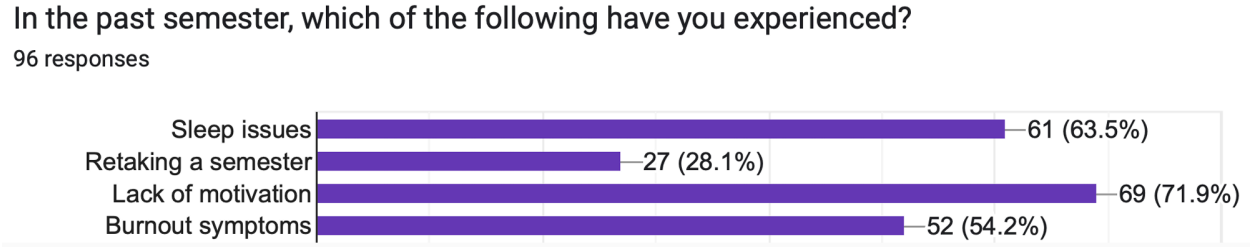
Inspiration REFLECT

Research

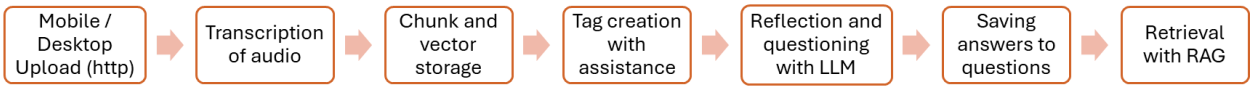
Survey results: (iman needs to add more)





Product context

Current system



Backend capabilties

- Stores journal entries with metadata (tags, scale responses, timestamps)
- Retrieves relevant past entries via semantic search (RAG)
- Generates reflective follow-up questions from context
- Tracks patterns over time (scale questions, recurring tags)

Constraints

- **Slow, deliberate experience (System 2 thinkinh)**
  No urgency, no gamification. Design for reflection, not speed.
- **Meaningful cognitive load**
  One insight or question at a time. Reduce noise, support thinking.
- **Non-authoritative AI**
  Suggests and asks, never tells or interprets feelings.
- **Always reversible**
  All AI outputs can be edited, dismissed, or undone easily.
- **User autonomy first**
  User initiates everything. No prompts or nudges when that is their prefernce.

- **Feels private and intimate**
  No social features. Calm, minimal design that resembles a personal journal.

Inspiration

NotebookLM

What we like:

- File/Context upload
- toggling sources

Journey

What we like:

- Wide selection of plugins

https://journey.cloud/app/plugins/

Daylio

What we like:

- The mood and tag feature for sources (for them its journals, for us its the sources)

Notta

What we like:

- File/Context upload

Notion

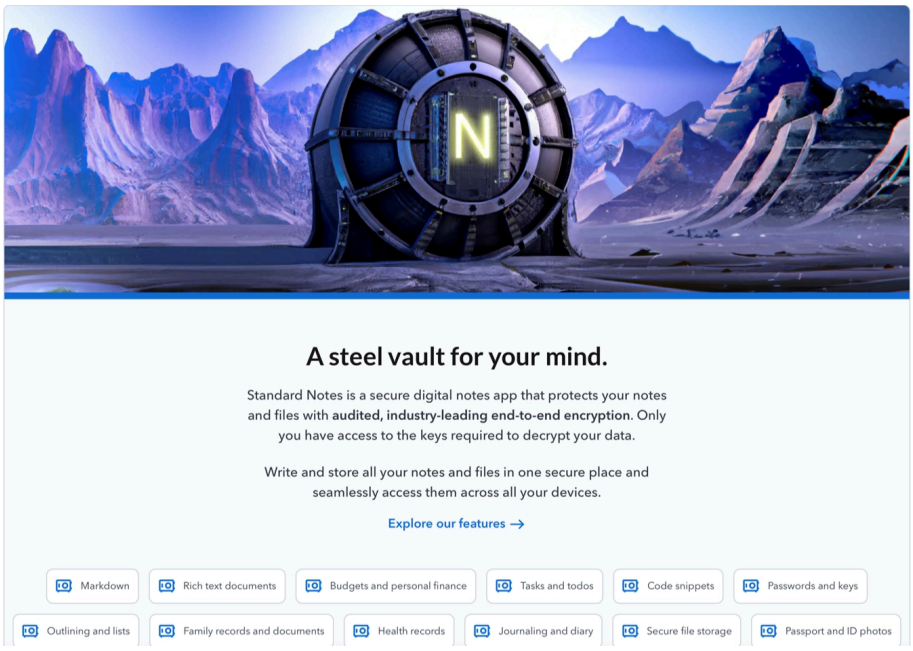
What we like:

- Effortlessness of starting to write

<u>Standard Notes</u>

What we like:

- Simplicity, functionality and self image delivery about trustworthyness

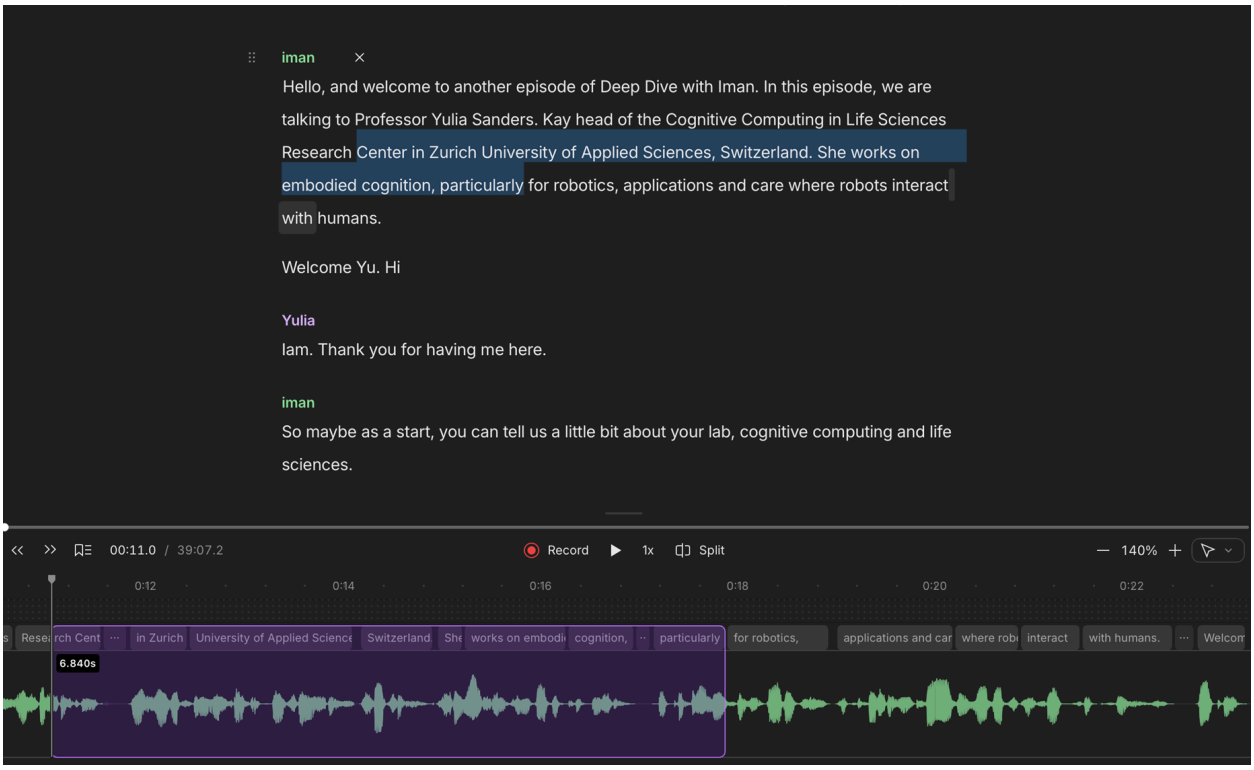


We like the visual representation of a vault for your mind.

<u>Descript</u>

What we like:

- text-audio synchrony



You can select and delete parts of the audio file by removing it from the transcript.

Optional starting point

Figma designs by HCD students

https://embed.figma.com/design/WGnn4KkMih7tNxnoWvIeU0/RFLCT?node-id=0-1&t=mOfxOI718ikIHHBE-0&embed-host=notion&footer=false&theme=system

Vibecoded frontend design

https://ai-reflect.vercel.app/

Our page ideas (THESE PAGES OR NOT MANDATORY)

Pages

/ = questions, sources, export, AI search, first onboard
/prosody = pauses, confidence in transcription and filler words
/source/{id} = detailed page of source, their tags, body and name
/account = activity, insights, personal and performance settings
/account/graph = obsidian like graph showing all connections through tags

Homepage

- Upload or record sources which are toggleable (text, .md, .wav, .m4a)
- Clarifying, Guiding in reflection and quantitative questions to answer
- Create tags for sources, user can ask AI advice, user can change output or create it themselves

Prosody

- Confidence in transcription of words
- Analysation and statistics of pauses while speaking
- Analysation and statistics of filler words

Source detail

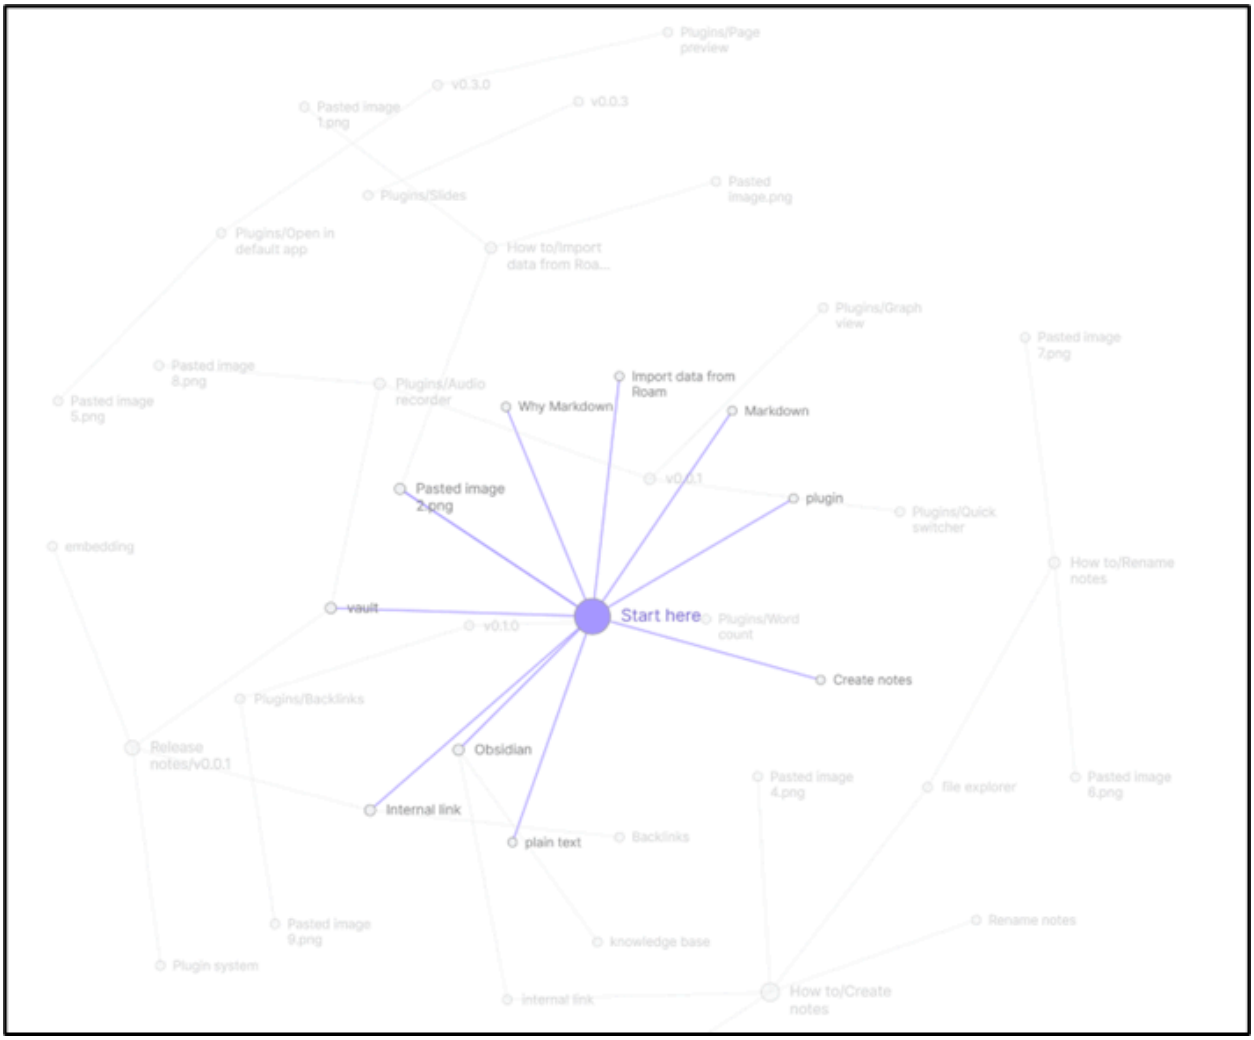
- Create, read, update and delete tags of sources
- Let LLM propose tags, which can be accepted, edited or declined

Account

- Activity, we like a github style agenda
- Insights (e. g. “Stress has been the most added tag over the last 2 weeks”)
- Settings (Model resources, export path)
- Possibly cloud settings (If we do API or cloud saving)

Account graph

- An obsidian like graph
- Connect tags together to see correlation
- Quickly see relations



Extra features

- Onboarding with user’s account info and settings
- Mobile upload, desktop processing
